

Electrimotion RF Shut Off Track Overview 1320ft.

The Electrimotion wireless shut down system will be located **past the finish line (approx 1720-2170ft)** at all events. When a car enters the RF field past the finish line the Safety Box will be wirelessly activated. In the event that a car smokes the tires, the driver can turn off 12v power in the car and disable the system, which will allow the car to coast off the track. 2 Antennas are to be placed on opposite walls per the diagram below. Do not place transmitters directly across from each other, they should be staggered.
