Top Fuel Ignition Run Simulator

The Electrimotion Top Fuel Ignition Run Simulator is used to provide both crank trigger pulses as well as a TDC pulse so you can test your ignition system.

The unit is also connected to your MSD start switch. When the throttle switch is made, the unit will produce an rpm pulse string that is similar to that of a top fuel car.

The RPM output is high enough to trigger the rev limiter function of the MSD 8971 ignition controller.
